

## Web Application Firewall (WAF)

Web Application Firewall is a tool used to protect web applications from attacks. It's deployed in front of a web application (or a webserver) and intercepts the traffic between the clients and the applications in order to

- Prevent unwanted user input to reach the application
- Prevent unwanted content to be leaked by the application
- Monitor the application traffic flow
- Log transaction data

### WAF 10GB

**RM120** one time

**10GB Bandwidth**

**Advanced DDoS Protection**

**Restore & repair changed file**

**Web Optimization**

**OWASP Core Rule Set**

**Reputation-based Threat Protection**

**Block Visitors by IP or country**

### WAF 40GB

**RM280** one time

**40GB Bandwidth**

**Advanced DDoS Protection**

**Restore & repair changed file**

**Web Optimization**

**OWASP Core Rule Set**

**Reputation-based Threat Protection**

**Block Visitors by IP or country**
